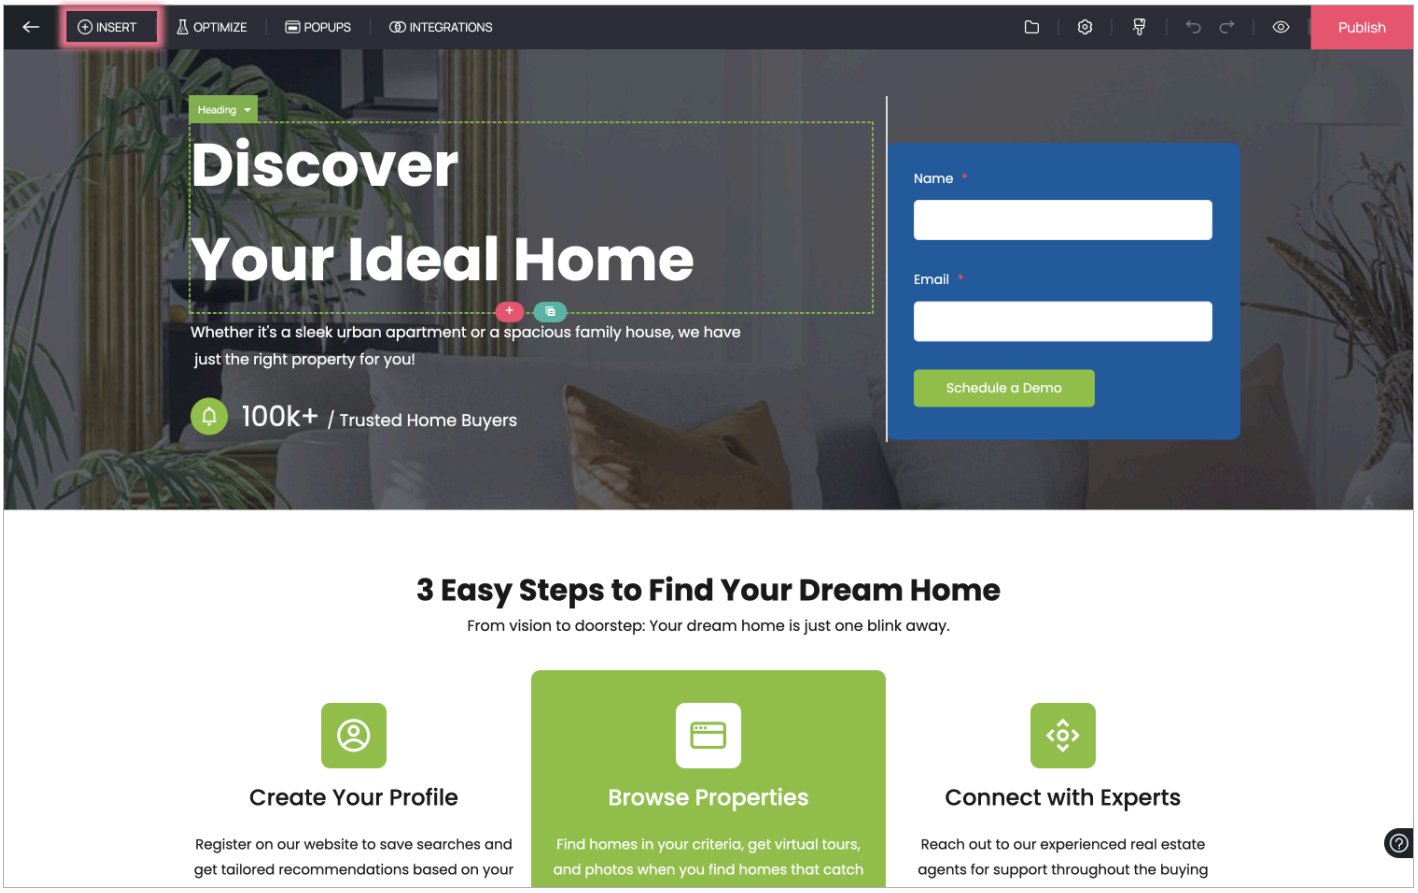
Tables

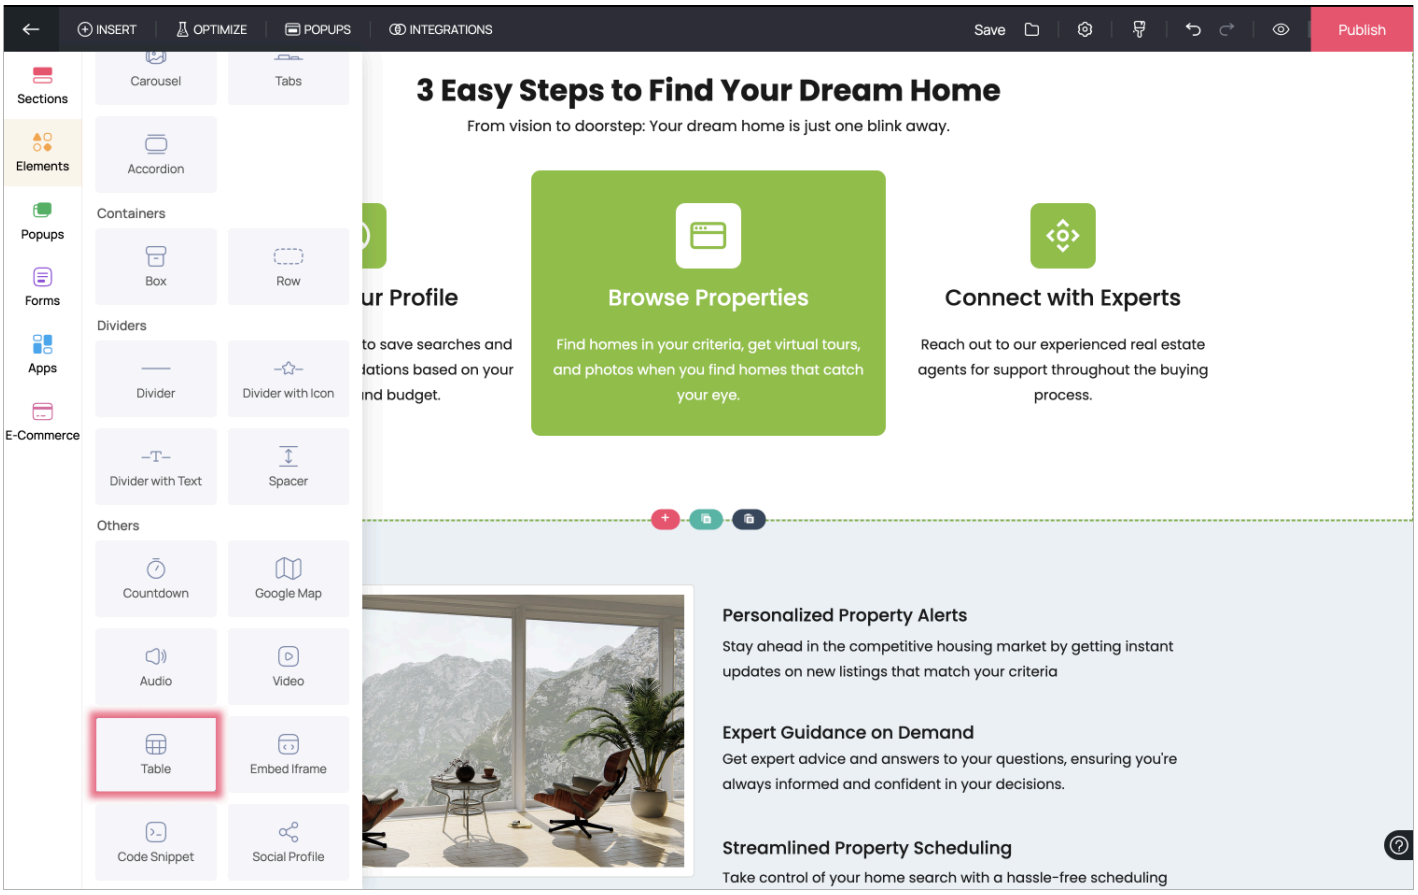
Tables on landing pages are effective in organizing and presenting information clearly. They allow for easy comparisons of features, prices, or services by laying them out side by side in a structured format. This not only helps in keeping the page neat but also aids visitors in quickly scanning and processing the information, making it easier for them to make informed decisions. By improving the clarity and accessibility of information, tables enhance user experience and engagement on the page.

Inserting a table

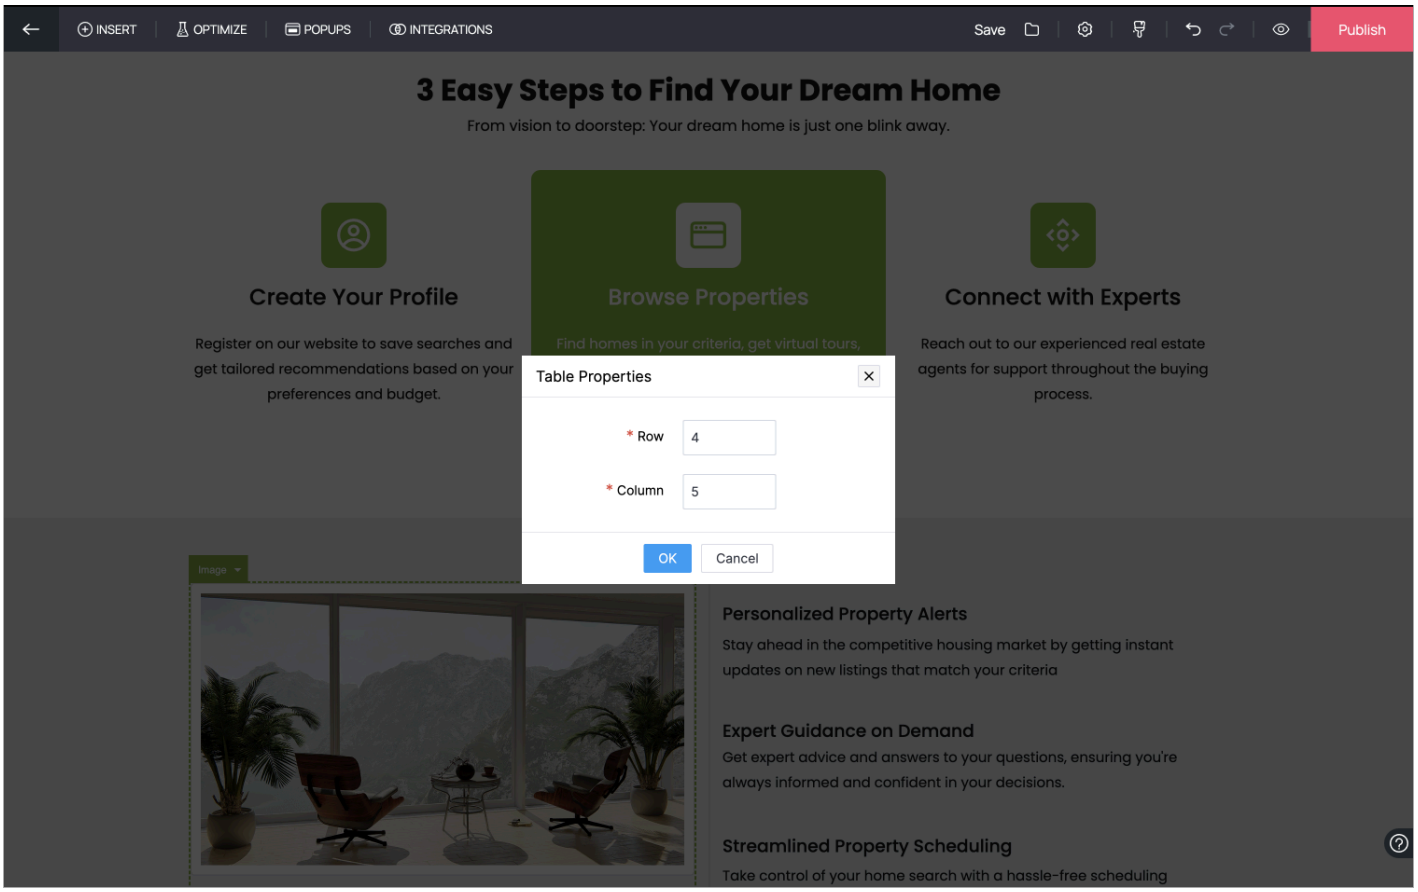
1. To add a image element to your landing page, click on the **Insert** button to view the menu.



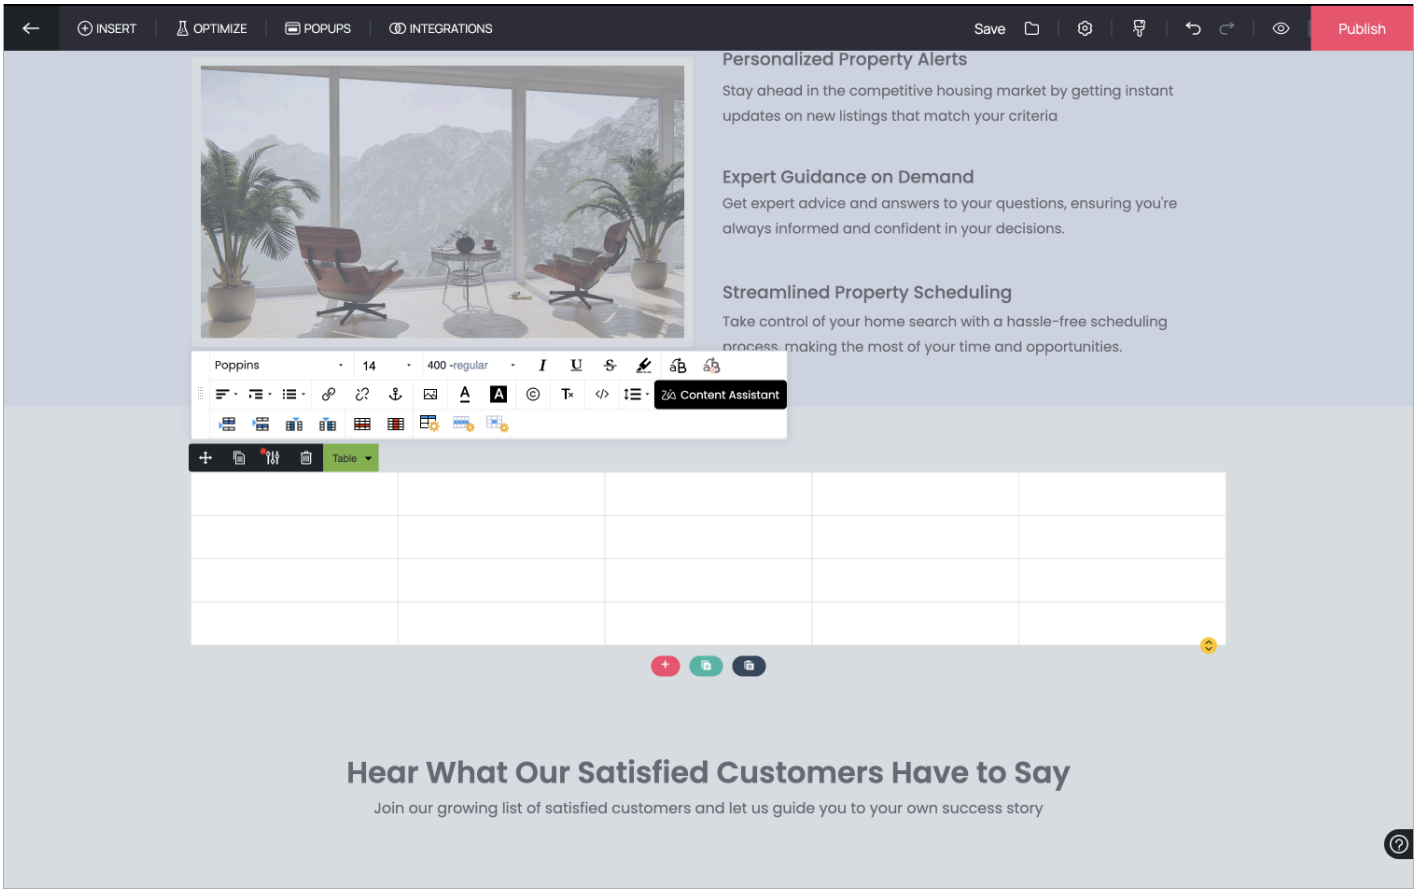
2. In the menu, click on the Elements tab and choose the **Table** element to be inserted in your landing page.



3. Choose the number of rows and columns required for the table and click on **OK.**

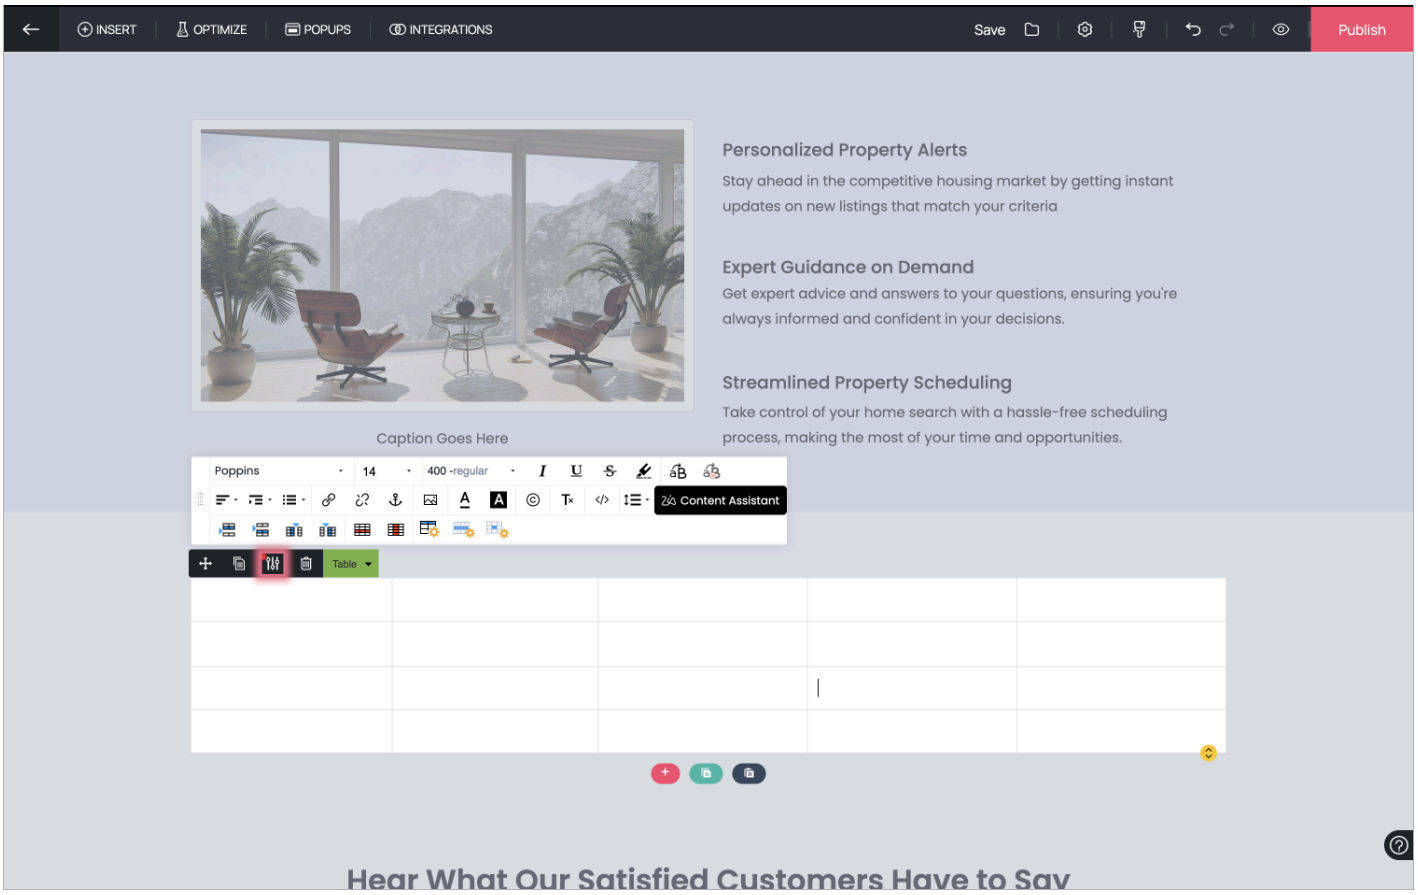


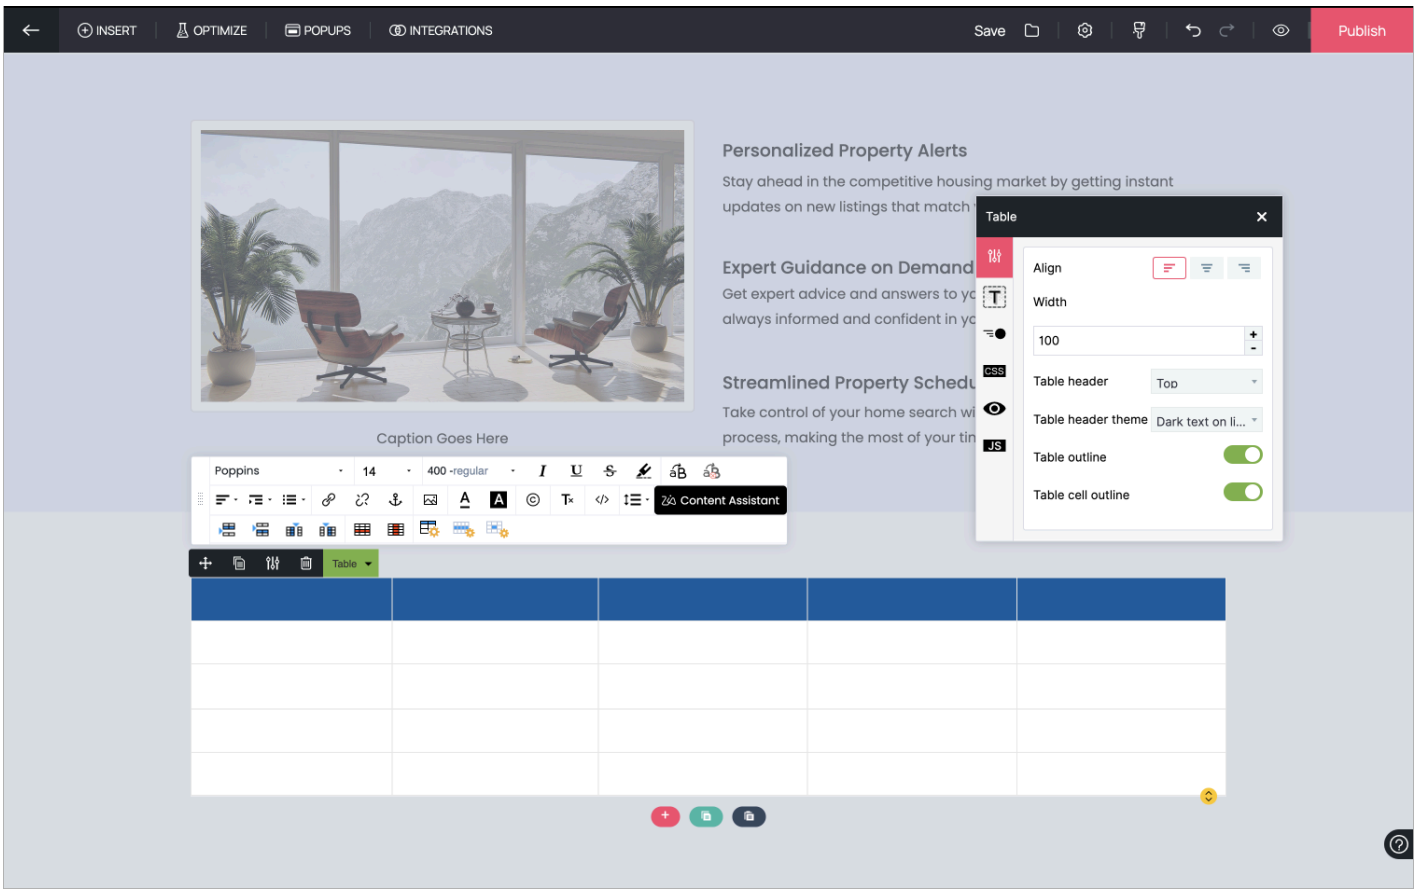
4. The table is now inserted in your landing page. You can enter the required data in the table fields



Accessing table properties

1. You can access basic table properties such as insert row/column, delete row/column, row, and cell properties in the landing page tool bar. You can access the overall table properties by clicking on the properties icon next to the element name in case it is not visible already.





2. In Table properties, you can change the table alignment and width. You can also add a table header or table/cell outline to further make it engaging for landing page visitors.
